**Abstract:** Please type in Times New Roman 11 point font

Presentation based upon the published article:

Davis, C., Ryninks, K., Dolby, S. (2013). A partnership approach to transplant preparation: Involving children, young people and their families. *British Journal of Renal Medicine*, 18 (4), 26-29.

**Key Points:**

- The renal transplant preparation programme (RTPP) at Bristol Royal Hospital for Children offers physical-psychological-social-informational support tailored to the specific needs of children/young people and their families through multi-disciplinary partnership working which aims to promote shared decision-making and positive patient experience
- The valuable findings of a patient and parent/carer reported experience survey are currently being used by the renal team to plan service improvement
- An RTPP review group is being established to work in partnership with families to co-design patient- and parent/carer-reported experience measures that will inform regular service review.
- A genuine partnership approach to renal transplant preparation that meets the needs of the people accessing it will promote confidence and trust, informed decision-making and better health outcomes.
- Update regarding the process and challenges faced – how to prioritise proactive service development work whilst responding to current patient and service need?
